# 1. Introduction

The purpose of this study is to evaluate potential improvements at the intersection of Palmetto Road and Arrowood Road/Spencer Lane in Tyrone, Georgia. The location of the intersection is shown below in Figure 1.

Figure 1: Study Area

## 2. Methodology

In this section, the methodology for this study is discussed in detail. The main elements in the study included Existing Conditions, Future Conditions, Improvement Alternatives, Operational Analysis, and Benefit-Cost Analysis.

### Existing Conditions

Existing conditions were inventoried including geometric conditions, traffic control, and traffic volumes. Traffic data for the study intersection were obtained from traffic counts previously conducted in 2018 for the Town of Tyrone. Crash data was obtained from the Georgia Electronic Accident Reporting System (GEARS) for the five most recent years of data, 2015 to 2019.

### Future Conditions

The estimated completion year (Base Year) for this project is 2022. Projected future conditions for this study were developed for the Design Year of the project, 2042. Base Year and Design Year conditions include the growth in traffic volumes expected to occur through the Year 2022 and 2042, respectively. The expected 2022 and 2042 volumes were estimated using historic traffic data collected and maintained by the Georgia Department of Transportation (GDOT). Historic traffic counts at nearby GDOT count stations, the data for which is provided in Appendix A, were examined and a growth rate of 1.0% annually was adopted. Applying this growth rate to the existing traffic volumes over a period of two and twenty-two years yielded the estimated traffic volumes for the Years 2022 and 2042, respectively.

## Improvement Alternatives

The Town of Tyrone indicated that both a roundabout and conventional intersection improvements should be included as alternatives for the study intersection. A preliminary and iterative process was conducted using capacity analysis to determine the most feasible and effective potential improvements at the study intersection, in addition to those suggested by Tyrone. The Improvement Alternatives chapter provides details for all the potential improvements included in the evaluation.

## Alternatives Evaluation

This chapter provides details of the in-depth operational analysis of the improvement alternatives. Operational analysis was conducted using capacity analysis and simulation. Evaluation of the study intersection was conducted under four different sets of conditions:

- **Existing (2020) Conditions:** Current geometric and traffic control conditions, existing traffic volumes
- **Base Year (2022) No-Build Conditions:** Current geometric and traffic control conditions, projected 2022 volumes (if no improvement were to be completed at the study intersection)
- **Base Year (2022) Build Conditions:** Improvements implemented, projected 2022 volumes
- **Design Year (2042) No-Build Conditions:** Current geometric and traffic control conditions, projected 2042 volumes (if no improvement were to be completed at the study intersection)
- **Design Year (2042) Build Conditions:** Improvements implemented, projected 2042 volumes

Signal warrant analysis was conducted for the traffic signal improvement alternative under 2022 and 2042 Build conditions to determine if a signal would be warranted at the study intersection at any point through the design life of the project. This analysis was performed in accordance with guidance provided in Chapter 4 of the Manual on Uniform Traffic Control Devices (MUTCD).

Capacity analysis was conducted for the study intersection under each set of analysis conditions using *Sidra 7* software for roundabout improvement alternatives and using *Synchro 10* software for non-roundabout improvement alternatives. The results of capacity analysis are reported in terms of Level of Service, which is a function of average delay per vehicle, in seconds. The Level of Service Scale according to the *Highway Capacity Manual* (HCM) is shown on the following page in Table 1.

Table 1: HCM Level of Service Scale

LEVEL OF SERVICE	AVERAGE DELAY PER VEHICLE (SECONDS)	
	STOP CONTROL	SIGNAL CONTROL
A	≤10.0	≤10.0
B	10.1 to 15.0	10.1 to 20.0
C	15.1 to 25.0	20.1 to 35.0
D	25.1 to 35.0	35.1 to 55.0
E	35.1 to 50.0	55.1 to 80.0
F	>50.0	>80.0

Simulation was conducted for the study intersection using *Simtraffic* software by Trafficware. Using *SimTraffic*, the intersection improvement alternatives were simulated to evaluate total delay, total travel time, and total fuel used. Total delay and total travel time are given in hours and include all vehicles in the network. Total fuel used is given in gallons of fuel used by all vehicles in the study network.

## Benefit-Cost Analysis

The benefit-cost analysis examined the financial savings from reductions in travel time and fuel consumption. These were compared to the estimated construction cost for each recommended improvement. There are other benefits of traffic improvement projects, but travel time and fuel consumption can be readily quantified.

The value of time used in this analysis was the average Fayette County hourly wage obtained from the Bureau of Labor Statistics. The average hourly wage used was \$23.55 per hour.

The average cost of a gallon of fuel in Georgia was obtained from AAA. The current value of regular gasoline used was \$1.97 per gallon.

Cost estimates for each recommended improvement were then converted to annual costs based on a 20-year project life cycle and a two percent annual compounded value of money. The total annual benefit found as described above was compared to the total annual cost to result in the Benefit-to-Cost or ‘B/C’ ratio. The higher the B/C ratio, the more benefit is expected from a project relative to its cost.

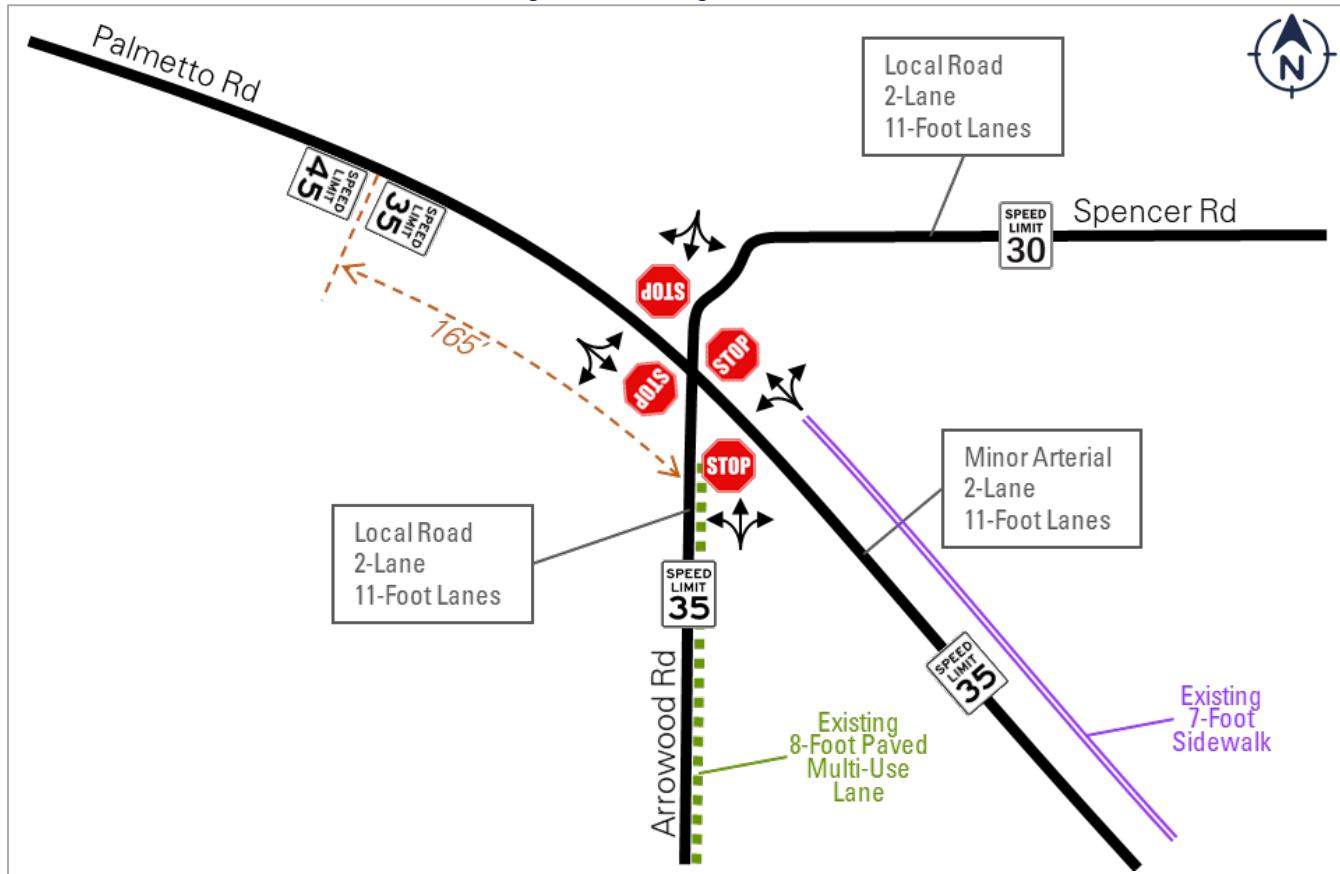

### 3. Existing Conditions

Existing geometry, traffic control conditions, and traffic volumes for the study intersection are provided in this chapter.

#### Intersection Geometry and Traffic Control

Existing intersection geometry and traffic control for the study intersection are summarized below in Figure 2.

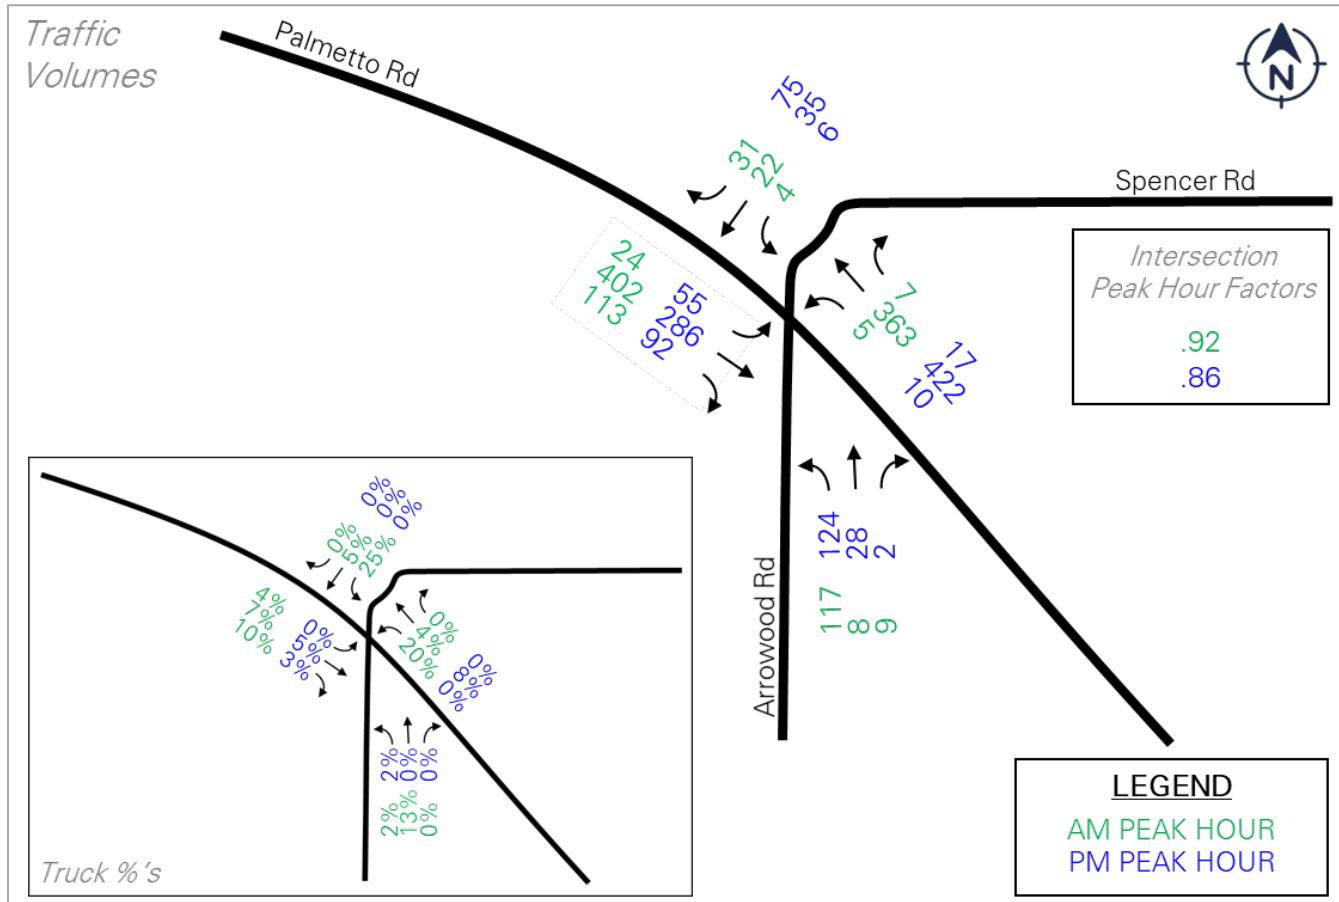

Figure 2: Existing Conditions

## Traffic Volume Data

Existing traffic volumes and associated data for the study intersection are shown below in Figure 3. This data was collected in 2018 as part of the SPLOST study for the Town of Tyrone. Traffic data reports for the study intersections are provided in Appendix B.

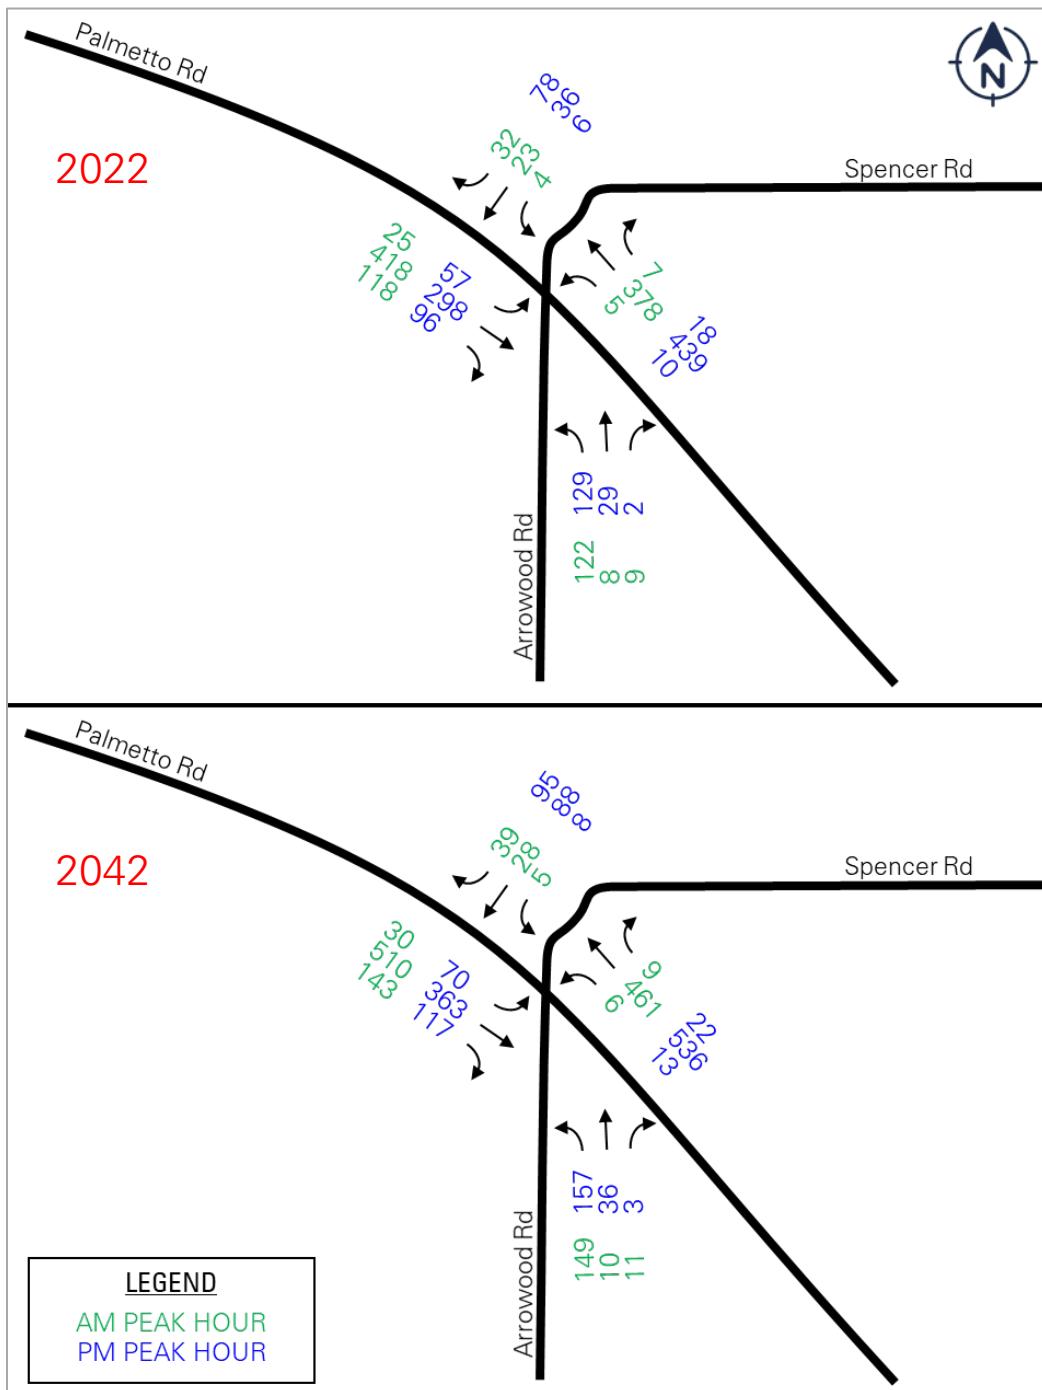

Figure 3: Existing Traffic Volume Data

## 4. Future Conditions

The Base Year (2022) and Design Year (2042) projected traffic volumes which were used to evaluate future conditions are shown below in Figure 4.

Figure 4: Projected Traffic Volumes

## 5. Improvement Alternatives

Multiple options were considered for improvement of the study intersection, including changes to geometric conditions and/or traffic control at the study intersection. The improvement alternatives determined to be most feasible through preliminary analysis and discussion with the Town of Tyrone are as follows:

- Installation of a traffic signal, with current geometric conditions
- Installation of a single-lane roundabout, centered at the current location of the intersection
- Installation of a single-lane roundabout, shifted northeast from the current location of the intersection

These improvement alternatives are described in the following sections. Details of the evaluation of these alternatives is provided in the next chapter. Concepts are provided in Appendix C.

### Traffic Signal

For this alternative, the study intersection would be converted to traffic signal control and would maintain the current intersection geometry, as shown below in Figure 5.

Pedestrian facilities would include signalized pedestrian crossings on the north, south, and east legs of the intersection. The planned 14-foot multi-use path would run along the east/south side of Spencer Lane, cross the east leg of the intersection, and connect into the existing path on the east side of Arrowood Road, south of Palmetto Road.

Figure 5: Improvement Concept – Traffic Signal

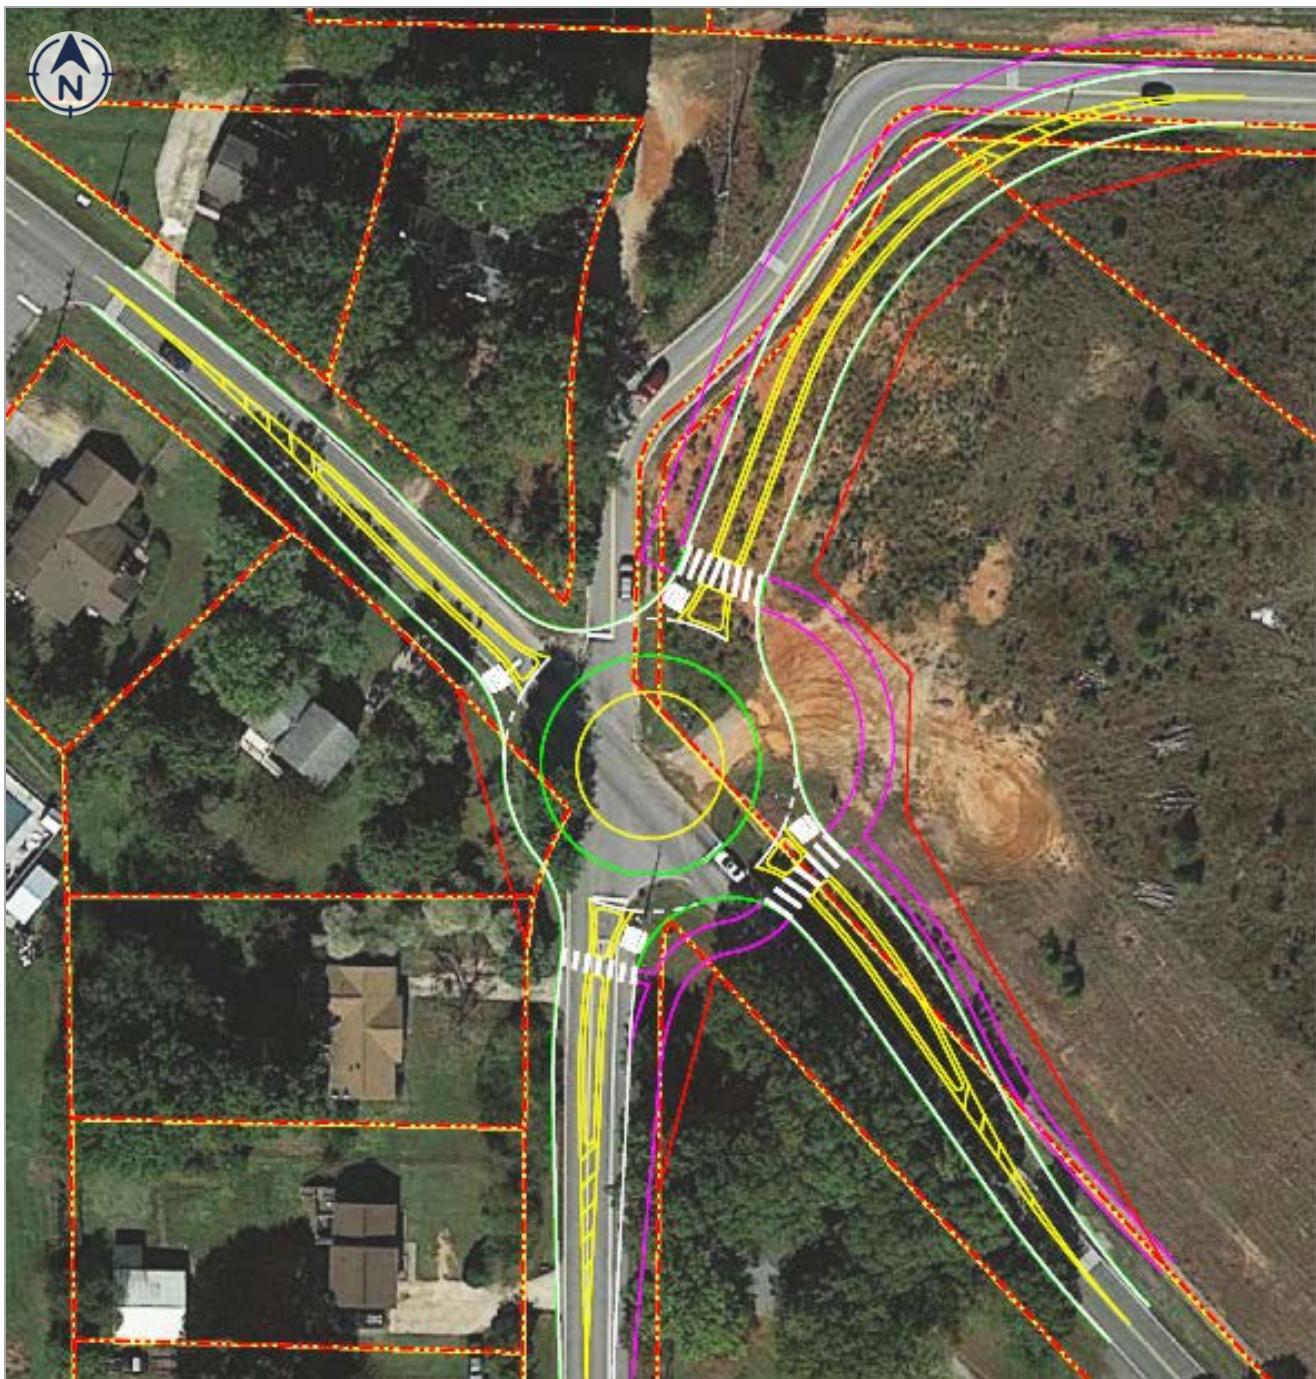

#### Roundabout, Current Intersection Location

The concept for the roundabout improvement centered at the current intersection location is shown on the following page in Figure 6.

Pedestrian facilities would include unsignalized pedestrian crossings on the north, south, and east legs of the intersection. The planned 14-foot multi-use path would run along the north/west side of Spencer Lane, cross the north and east legs of the intersection, and connect into the existing path on the east side of Arrowood Road, south of Palmetto Road.

Figure 6: Improvement Concept – Roundabout, Current Intersection Location

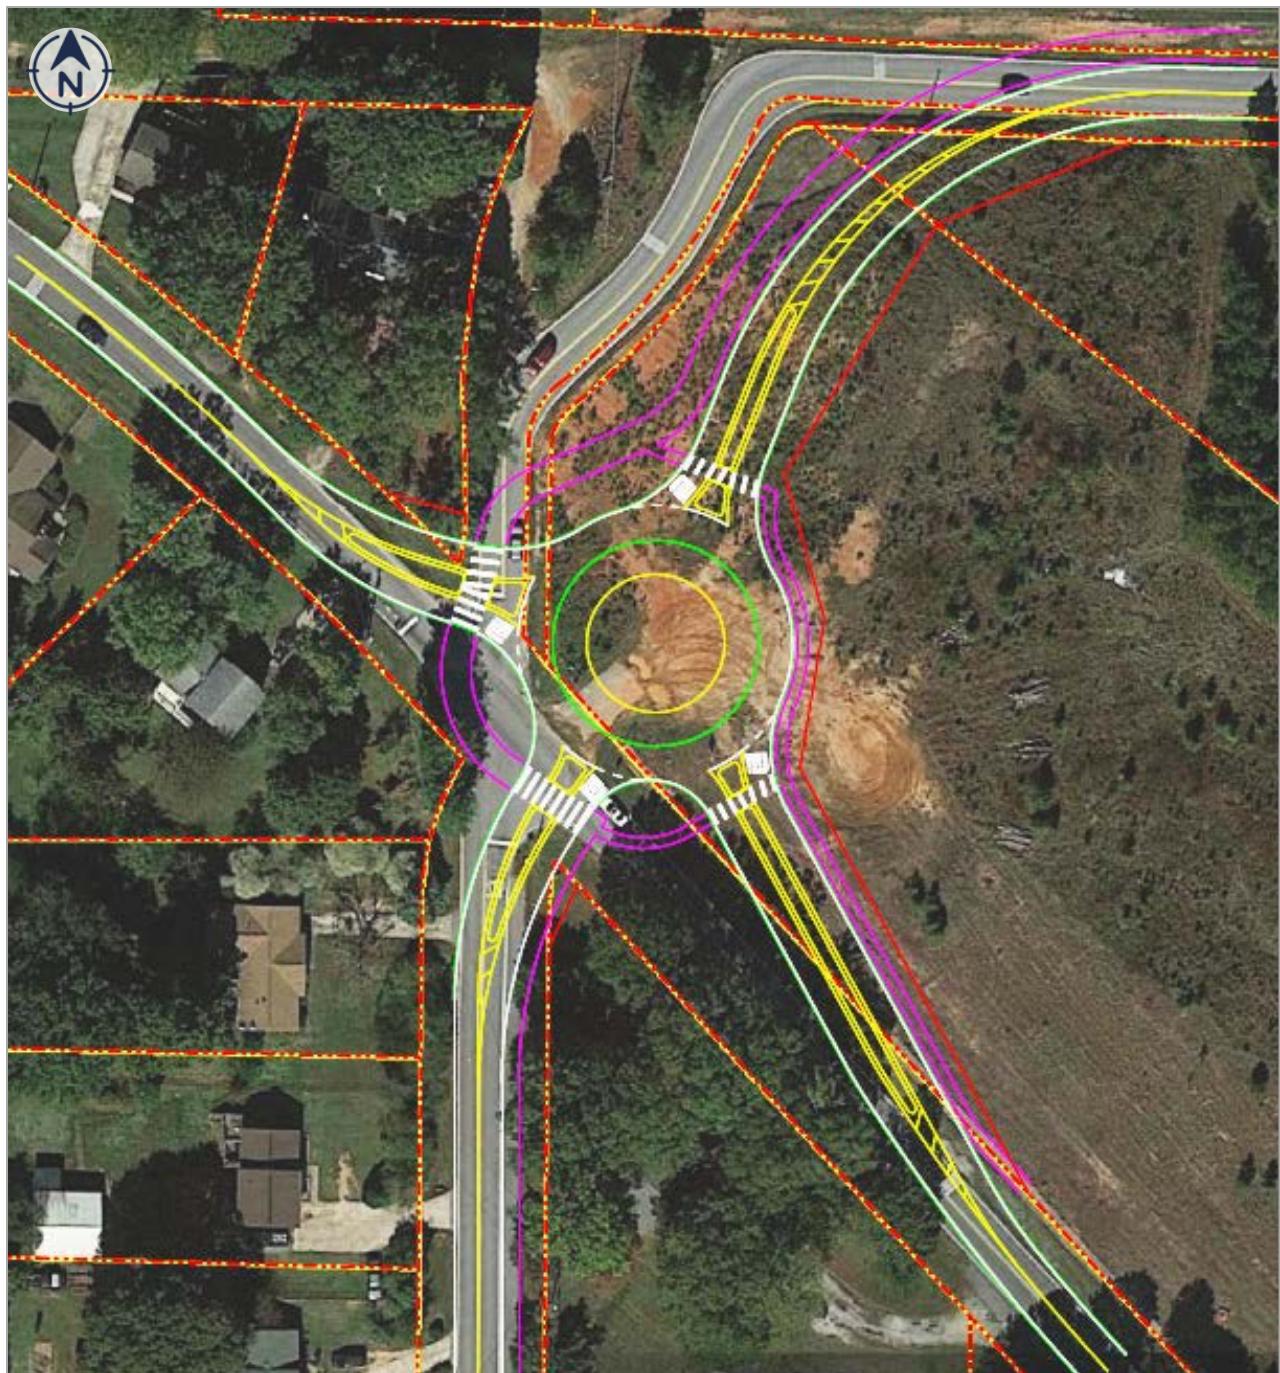

### Roundabout, Shifted Northeast

The concept for the roundabout improvement shifted northeast of the current intersection location is shown on the following page in Figure 7. This roundabout concept was designed to minimize right-of-way acquisition in properties that are currently developed.

Pedestrian facilities would include unsignalized pedestrian crossings on all four legs of the intersection. The planned 14-foot multi-use path would run along the north/west side of Spencer Lane, cross the west and south legs of the intersection, and connect into the existing path on the east side of Arrowood Road, South of Palmetto Road.

Figure 7: Improvement Concept – Roundabout, Shifted Northeast

## 6. Alternatives Evaluation

The results of capacity analysis, simulation, and benefit-cost analysis are provided in this section.

### Signal Warrant Analysis

The results of signal warrant analysis are summarized below in Table 2. For each warrant examined, the result is provided in terms of ‘actual hours met / hours required to be met to satisfy warrant’.

Table 2: Signal Warrant Analysis Results

Signal Warrant	Method	Base Year (2022)		Design Year (2042)	
		Hours Met	Warrant Satisfied? (Y or N)	Hours Met	Warrant Satisfied? (Y or N)
Warrant 1 – Condition A Eight Highest Hours	Conventional	1/8	N	4/8	N
Warrant 1 – Condition B Eight Highest Hours	Conventional	3/8	N	5/8	N
Warrant 2 Four Highest Hours	Conventional	2/4	N	4/4	Y

Signal warrant analysis results indicate Signal Warrant 2 is expected to be warranted by the Design Year of the project, but not by the Base Year of the project. Signal warrant analysis was then conducted for multiple years between the base and design years of the project to get a better idea of when exactly the intersection is expected to warrant installation of a traffic signal. It was determined that the intersection is expected to warrant installation of a traffic signal based on Signal Warrant 2 by 2037.

## Capacity Analysis

Capacity analysis results for the study intersection under existing and No-Build conditions are shown below in Table 3. Capacity analysis reports are provided in Appendix D.

Table 3: Capacity Analysis Results – Existing and No-Build Conditions

Approach	AM Peak Hour			PM Peak Hour		
	Existing (2020)	No-Build (2022)	No-Build (2042)	Existing (2020)	No-Build (2022)	No-Build (2042)
Palmetto Road & Arrowood Road/ Spencer Road	EB	D (30.9)	E (37.6)	F (129.6)	D (32.0)	E (43.0)
	WB	C (19.4)	C (21.5)	E (44.4)	E (36.6)	F (50.1)
	NB	B (12.5)	B (13.0)	C (15.8)	B (14.9)	C (16.0)
	SB	B (11.1)	B (11.4)	B (13.2)	B (12.8)	B (13.6)
	Intersection	C (23.7)	D (27.8)	F (80.9)	D (29.6)	E (39.2)

Capacity analysis results indicate that under existing conditions, the study intersection is operating at LOS 'C' and LOS 'D' in the AM Peak Hour and PM Peak Hour, respectively. If no improvement is made to the intersection, operation is expected to degrade to LOS 'F' with a delay per vehicle of 81 seconds and 130 seconds in the AM Peak Hour and PM Peak Hour, respectively, in the Year 2042.

Capacity analysis results for the study intersection under Build conditions with the different improvement alternatives discussed in Chapter 5 are shown on the following page in Table 4. The results for Build conditions are shown side-by-side with the results for No-Build conditions for ease of comparison.

Table 4: Capacity Analysis Results – Improvement Alternatives

Approach	AM Peak Hour						PM Peak Hour					
	2022			2042			2022			2042		
	No-Build	Traffic Signal	Round-about	No-Build	Traffic Signal	Round-about	No-Build	Traffic Signal	Round-about	No-Build	Traffic Signal	Round-about
EB	E (37.6)	B (11.8)	A (9.2)	F (129.6)	B (17.4)	B (12.0)	E (43.0)	B (17.6)	A (8.9)	F (154.5)	C (30.1)	B (13.2)
WB	C (21.5)	A (9.3)	A (8.4)	E (44.4)	B (10.9)	B (10.9)	F (50.1)	B (16.5)	B (14.8)	F (179.6)	C (23.6)	C (27.3)
NB	B (13.0)	C (21.1)	A (7.2)	C (15.8)	C (31.2)	A (9.1)	C (16.0)	C (23.4)	A (7.4)	C (23.3)	C (31.9)	A (9.8)
SB	B (11.4)	B (10.2)	A (6.4)	B (13.2)	B (12.7)	A (7.9)	B (13.6)	A (8.8)	A (9.6)	C (21.3)	B (17.6)	B (19.5)
Intersection	D (27.8)	B (12.0)	A (8.5)	F (80.9)	B (16.6)	B (11.1)	E (39.2)	B (17.0)	B (11.0)	F (130.1)	C (26.3)	B (18.9)

Capacity analysis results indicate both the traffic signal alternative and the roundabout alternative yield considerably improved traffic operation compared to No-Build conditions during both peak hours through the design year of the project. The roundabout alternative is the superior option from a traffic operation standpoint, as it yields the lower delays per vehicle during every analysis period.

## Simulation

Simulation results for the study intersection under Build conditions with the different improvement alternatives are shown below in Table 5, provided side-by-side with No-Build results for ease of comparison. Simulation reports are provided in Appendix E.

Table 5: Simulation Results

Simulation Metric	AM Peak Hour						PM Peak Hour					
	2022			2042			2022			2042		
	No-Build	Traffic Signal	Round-about	No-Build	Traffic Signal	Round-about	No-Build	Traffic Signal	Round-about	No-Build	Traffic Signal	Round-about
Travel Time (hr)	10.9	10.5	8.8	25.7	20.8	11.5	14.7	14.5	9.8	101.1	25.6	12.8
Total Delay (hr)	4.9	4.5	1.9	18.2	13.2	2.8	8.0	7.9	2.2	93.8	17.7	3.7
Fuel Used (gal)	8.8	8.2	8.3	13.7	12.6	10.5	10.4	10.2	9.2	30.4	14.3	11.4

Simulation results indicate the roundabout alternative yields the lower travel time, total delay, and fuel used during every analysis period.

## Benefit-Cost Analysis

The benefit-cost analysis examined the present value of total benefits to be gained through the design life of each improvement alternative in comparison to the estimated present cost of each alternative. The results of the benefit-cost analysis are summarized below in Table 6. The higher the B-C ratio, the more benefit is gained per dollar of cost. Cost estimates for each improvement alternative are provided in Appendix F. Detailed calculations of benefits are included in Appendix G.

Table 6: Benefit-Cost Analysis Summary

Improvement Alternative	Present Value of Total Benefits Through Design Life	Present Value of Estimated Cost	B-C Ratio
Traffic Signal	\$12,180,303.36	\$265,005.00	46
Roundabout (Current Location)	\$16,605,804.55	\$1,288,609.00	13
Roundabout (Shifted NE)	\$16,605,804.55	\$1,393,213.00	12

The traffic signal alternative yields the highest B-C ratio, with the roundabout alternative at the current intersection location second, and the roundabout alternative shifted to the northeast third.

## 7. Summary

The purpose of this study was to evaluate traffic improvements at the intersection of Palmetto Road and Arrowood Road/Spencer Road in Tyrone, Georgia.

Multiple alternatives were evaluated using capacity analysis and simulation under No-Build and Build conditions for the Base Year (2022) and the Design Year (2042) of the project. Design year volumes were projected using a 1% annually compounding growth rate over the period between the existing year and the Base and Design Years. Based on the results of capacity analysis and simulation, a Benefit-Cost (B-C) ratio was determined for each improvement alternative.

The alternatives evaluated include a traffic signal with the current intersection geometry, a single-lane roundabout at the current location of the intersection, and a single-lane roundabout shifted to the northeast from the current intersection location. Each of these alternatives provides pedestrian and multi-use trail connection to the existing paved multi-use lane along the east side of Arrowood Road. The traffic signal is expected to be warranted in the Year 2037.

Both the traffic signal and roundabout improvement alternatives provide significantly improved capacity analysis results compared to No-Build conditions through the design life of the project. The roundabout alternative yields slightly better results, with between 4 and 8 seconds less delay per vehicle than the traffic signal alternative through the design life of the project.

Both the traffic signal and roundabout improvement alternatives provide significantly improved simulation results compared to No-Build conditions through the design life of the project. The roundabout alternative yields slightly better results, with between 3 and 14 hours less of total delay at the intersection than the traffic signal alternative through the design life of the project.

The traffic signal alternative yields the highest B-C ratio of the three alternatives.

## **MetroCount Traffic Executive** **Daily Classes by Direction**

### **DayClassSplit-67 -- English (ENU)**

#### **Datasets:**

**Site:**  Tyrone Road  
**Attribute:** Tyrone Rd at Briaiwood Rd  
**Direction:** 8 - East bound A>B, West bound B>A. **Lane:** 0  
**Survey Duration:** 8:24 Tuesday, May 08, 2018 => 13:53 Friday, May 11, 2018,  
**Zone:**  
**File:** Tyrone Rd at Briarwood 1.EC0 (Plus )  
**Identifier:** JG353AN2 MC56-L5 [MC55] (c)Microcom 19Oct04  
**Algorithm:** Factory default axle (v4.06)  
**Data type:** Axle sensors - Paired (Class/Speed/Count)

#### **Profile:**

**Filter time:** **15:00 Tuesday, May 08, 2018 => 11:00 Friday, May 11, 2018 (2.83333)**  
**Included classes:** 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13  
**Speed range:** 6 - 99 mph.  
**Direction:** North, East, South, West (bound), P = East  
**Separation:** Headway > 0 sec, Span 0 - 328.084 ft  
**Name:** Default Profile  
**Scheme:** Vehicle classification (Scheme F3)  
**Units:** Non metric (ft, mi, ft/s, mph, lb, ton)  
**In profile:** Vehicles = 28248 / 29696 (95.12%)

## Daily Classes by Direction

**DayClassSplit-67**

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).  
Roundabout LOS Method: Same as Signalised Intersections.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: SIDRA Standard.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: SIDRA Standard (Akcelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
